PROFILE

A software developer with 3+ years of experience, I have a strong foundation in **Data Structures and Algorithms (DSA)** for solving complex problems. I specialize in developing **RESTful APIs** and **data pipelines** using **Node.js**, **Express.js**, **PostgreSQL**, **MongoDB**, and **MySQL**, as well as working with **Spring Boot**, **Hibernate**, and **JPA**. I have experience in **microservices architectures**, **data migration pipelines**, **orchestration services**, **Low-Level Design (LLD)**, and **Flutter** development. I am passionate about tackling technical challenges and contributing to impactful projects.

EDUCATION

Indian Institute of Technology <i>Master of Technology (MTech), Ocean Engineering and Naval Architecture</i>	Kharagpur, India <i>Jan 2020 – Dec 2022</i>
Global Institute of Technology <i>Bachelor of Technology (BTech), Mechanical Engineering</i>	Jaipur, India <i>Jan 2016 – Dec 2020</i>

TECHNICAL SKILLS

Programming Languages: JavaScript, Java, SQL, Dart
Frameworks & Tools: Node.js, Express.js, Spring Boot, Hibernate, JPA, Flutter, RabbitMQ
DevOps: Docker, Git & GitHub, AWS, Azure
Databases: PostgreSQL, MongoDB, MySQL, SQLite
Concepts: Data Structures & Algorithms, OOPs, DBMS, Computer Networks, Microservices Architecture

EMPLOYMENT HISTORY

Skeps <i>Software Developer</i>	Gurugram <i>Jun 2025 – Present</i>
- Designed and developed data migration pipelines in the Data Warehouse service, ingesting data from MongoDB and persisting it into MySQL for structured analytics and reporting. Leveraged database cursors to stream data incrementally instead of loading entire datasets into memory, significantly reducing memory overhead. - Worked on the Data Lake service, building pipelines that extract data from MySQL and load it into the data lake using cursor-based streaming for efficient, memory-safe data processing. - Developed and maintained orchestrator services (pos_finance, pos_customer, and others) that manage end-to-end flows for customers, merchants, and lenders on the Skeps lending portal. - Worked with Node.js, MongoDB, MySQL, Docker, and Azure to build and deploy scalable backend services.	
Cubastion Consulting <i>Senior Associate Consultant</i>	Gurugram <i>Oct 2022 – May 2025</i>
- Led projects and delivered innovative solutions with a focus on scalable backend systems. - Developed and maintained microservices and REST APIs for client applications. - Gained hands-on experience in mobile application development using the Flutter framework. Copper & BitGo: Integrated Copper and BitGo with CLST as third-party services for digital asset transactions. Developed separate microservices for each, with REST APIs and webhooks to ensure efficient and secure communication. CLST: Developed REST APIs using Node.js with Express and PostgreSQL, leveraging Sequelize ORM for database interactions. Worked on microservices architecture to enhance modularity and scalability. Voltas: Developed a cross-platform mobile application using Flutter. Implemented UI, managed network requests via HTTP package, built background services, integrated local and push notifications using FlutterLocalNotification, used Sqflite for local storage, and incorporated MapMyIndia for maps.	

PROJECTS

- Designed a microservices-based e-commerce platform with independent **User**, **Product**, **Cart**, and **Order** services (Spring Boot), each owning its own database and communicating via REST APIs and **RabbitMQ**.
- Built the **Order Service** to orchestrate order placement by aggregating cart contents and current product prices, computing the final amount, and storing a purchase-time price snapshot per item for historical accuracy.
- Applied **Low-Level Design (LLD)** principles to enforce clear service boundaries and database ownership across services.
